

AP Cybersecurity - Unit 1 Review Kahoot

14 questions

Q1. Which of the following is the strongest indicator of a phishing email?

- A) The email uses the company logo
- B) The address contains a subtle misspelling (g00gle.com) *
- C) The email is addressed to you by name
- D) The email contains an unsubscribe link

Q2. A user notices logins from unfamiliar IP addresses during school hours. Most likely a sign of:

- A) A brute force attack in progress
- B) Successful credential compromise *
- C) Normal account activity
- D) A DDoS attack

Q3. Which of the following is NOT a recommended practice on public Wi-Fi?

- A) Use a VPN
- B) Connect to any open network with "Free Wi-Fi" in the name *
- C) Ensure websites use HTTPS
- D) Turn off file sharing

Q4. A hotspot broadcasts the same network name as a coffee shop's Wi-Fi. This attack is:

- A) A brute force attack
- B) An evil twin attack *
- C) A dictionary attack
- D) A credential stuffing attack

Q5. Which adversary type is most motivated by financial gain?

- A) Hacktivists
- B) Script kiddies
- C) Transnational criminal organizations *
- D) Cyberterrorists

Q6. Which of the following is the clearest indicator of a social engineering attack?

- A) An email that arrives during school hours
- B) Urgency that pressures you to act before checking *
- C) A newsletter you subscribed to
- D) An email with an attachment you requested

Q7. Maya's cat's name, jersey number, and school are all public. What protects her accounts?

- A) Posting less often so attackers find fewer facts
- B) Building passwords from non-public information *
- C) Adding more friends she knows in real life
- D) Changing her username every month

Q8. Why can a single data breach lead to multiple accounts being compromised?

- A) Because strong passwords are easy for attackers to guess
- B) Because attackers test it on many other websites
- C) Because users reuse one password on many accounts *
- D) Because all accounts are connected automatically

Q9. A website you visit on cafe Wi-Fi shows a certificate warning. What should you do?

- A) Click through it - warnings are usually fake
- B) Leave the site; the connection may be intercepted or spoofed *
- C) Reload the page until the warning disappears
- D) Enter your password quickly before the warning returns

Q10. Which of these is an example of adversaries using AI to augment an ATTACK?

- A) An AI tool flagging SQL injection in code before release
- B) An AI writing phishing emails with zero grammar errors *
- C) An SOC dashboard alerting on unusual process behavior
- D) A password manager generating a long random password

Q11. AI makes AI-capable tasks free. What happens to human-accountable tasks' value?

- A) It decreases, because AI eventually does everything
- B) It stays exactly the same
- C) It increases - human judgment becomes MORE valuable *
- D) It disappears, because AI handles accountability too

Q12. Deepfake voice scams (like the fake-parent call) work because AI can:

- A) Clone a voice from samples posted online *
- B) Break passwords instantly
- C) Block scam calls automatically
- D) Translate voices in real time

Q13. Which of these is a DEFENSIVE use of AI?

- A) Flagging SQL injection in code before release *
- B) Cloning a CEO's voice to approve transfers
- C) Writing phishing emails at scale
- D) Scraping profiles to guess passwords

Q14. OpenAI's postmortem: agents evaded monitoring for weeks. The defense lesson:

- A) Monitoring only works if alerts reach humans fast *
- B) Monitoring is unnecessary for AI systems
- C) Agents can never disable their own monitors
- D) Logs alone are enough; audits are optional
